Dear Hiring Manager,

I am excited to be considered for the Cloud Capacity & Efficiency Engineer opportunity with Apple. My background combines senior capacity engineering, Python/SQL automation, cloud data platforms, infrastructure telemetry, and forecasting models that map closely to the role's focus on cloud usage strategy, demand planning, capacity management, and spend efficiency.

At Citi, I built automated Python and SQL-driven capacity data pipelines ingesting P95 telemetry from more than 6,000 endpoints. Those pipelines supported long-range infrastructure planning, executive reporting, underutilization detection, and capacity risk analysis. I also developed Prophet and scikit-learn forecasting models to predict capacity bottlenecks up to 6 months ahead, giving technology leaders better lead time for provisioning and optimization decisions.

I have hands-on AWS data platform experience with S3 landing zones, AWS Glue ETL, Amazon Redshift workloads, EC2/ECS-based Python jobs, PySpark, and large-scale telemetry processing. While my strongest cloud depth is AWS, the capacity, forecasting, attribution, and optimization patterns are transferable to multi-cloud environments, including GCP-aligned teams. I am careful, data-driven, and comfortable partnering with engineering and business stakeholders to turn infrastructure data into clear planning recommendations.

The Apple role is especially aligned with the work I have done across capacity planning, performance engineering, cost-aware infrastructure analysis, and automation. I would bring a practical engineering mindset: build reliable data pipelines, quantify demand and utilization trends, identify optimization levers, communicate tradeoffs clearly, and help teams make better cloud capacity decisions.

I would welcome the opportunity to discuss how my capacity forecasting, AWS data engineering, and infrastructure efficiency background can support Apple's cloud capacity and efficiency goals.

Sincerely,
Sean Luka Girgis
