Dear Hiring Manager,

I am interested in the Senior Performance Engineer role with CSS Tec. My background aligns strongly with performance engineering, LoadRunner/HP Performance Center exposure, Dynatrace/AppDynamics/CA APM observability, Java/J2EE diagnostics, AWS-aware platform analysis, and capacity forecasting for mission-critical enterprise systems.

At Citi, I led capacity and performance analytics across banking infrastructure using telemetry from more than 6,000 endpoints. I built Python and Pandas pipelines that integrated BMC TrueSight/TSCO, CA APM, and AppDynamics data into governed reporting datasets, then used dashboards, trend analysis, and forecasting models to identify bottlenecks and communicate risk to senior stakeholders.

Earlier in my career, I worked directly in performance engineering and APM-heavy roles. At G6 Hospitality, I managed Dynatrace AppMon and Gomez Synthetic Monitoring, integrated HP Performance Center with Dynatrace, and used real-user and synthetic performance metrics to provide optimization recommendations. At AT&T, I analyzed J2EE applications under load, diagnosed JVM/thread/JDBC/CPU bottlenecks, and documented baselines and release thresholds for engineering teams.

The CSS Tec role is a strong fit because it combines hands-on performance testing, APM observability, cloud-native performance analysis, root-cause diagnosis, reporting, and technical leadership. I can contribute immediately in performance strategy, workload analysis, telemetry interpretation, stakeholder-ready reporting, and practical tuning recommendations, while being careful and transparent around tools where my experience is adjacent, such as K6, Gatling, Datadog, and New Relic.

I would welcome the opportunity to help CSS Tec deliver reliable, scalable, and well-instrumented performance engineering outcomes for large-scale enterprise applications.

Sincerely
Sean Luka Girgis
